How to port pictures from android to iphone

For most people, the best, if not the only, camera they own is the one on their phone. So when it comes time to upgrade — whether you're going from an Android to an iPhone or vice versa — some of the most important things you'll want to transfer are your pictures. If you keep reading, you'll learn how to transfer pictures from Android to iPhone or from iPhone to Android. Transfer photos from iPhone to Android If you're transferring pictures from your iPhone to an Android, the process is relatively straightforward. Again, if you only want to move a couple of pictures, then email or text may be the way to go. But if you want to transfer an album or two, or even your entire library, you'll want to keep reading for instructions. Before you move your photos from iPhone The saying is true: "Garbage in, garbage out." And that's especially true when it comes to the data on your phone. So before you just dump your entire photo library onto your new Android device, quickly clean it up using the app Gemini Photos. Download Gemini Photos from the App Store and follow these steps to start cleaning your photo library: Open Gemini Photos and let it scan your library. Tap on a category like Similar. Tap a date range or event. Select the picture you want to delete and tap Move to Trash. After you've gone through all of your similar pictures, tap Empty Trash. Tap Your Library to go back and choose another category like Duplicates, Blurred, Notes, and Screenshots. How to send pictures from iPhone to Android Transferring a few pictures from your iPhone to Android is pretty simple. The only catch is that you'll need to use an app called Send Anywhere, which we used in the previous section. Like before, you can wirelessly transfer your pictures as long as you have both phones in the same room. Open the Send Anywhere app on both of the phones. On your iPhone, tap Send. Select the picture you want to transfer. Tap Send. On your Android, tap Receive. Either type in the 6-digit code on your Android's screen or scan the QR-code. Can I AirDrop iPhone photos to an Android phone? AirDrop is a feature made by Apple solely for their devices. That means it isn't possible to simply AirDrop pictures and videos to an Android phone. But there are other apps and websites, like Snapdrop, that offer similar functionality. How to transfer photos from iPhone to Android Similarly to transferring your entire library from an Android to an iPhone, you can transfer your whole library from iPhone to Android — all without plugging into a computer — thanks to Google Photos or other cloud-based photo sharing apps. To transfer your entire photo library: Download Google Photos from the App Store. Open Google Photos and sign in to your Google account. Tap Get Started. Tap OK when asked to allow Google Photos to access your photos. Tap Continue. Select High quality and then tap Continue. Tap No thanks to finish the setup and start uploading your pictures. While your library is uploading, download Google Photos on your Android. On your Android, open Google Photos. Sign in to your Google account. Choose High quality and then tap Confirm. Wait for your photos and videos to download. Transfer photos from Android to iPhone Transferring your photos from Android to iPhone doesn't have to be a long and tedious process; it all depends on how many pictures you want to copy over. Of course, if you only want to transfer a handful of photos, you can always email or text them to yourself, but we wouldn't recommend doing this for more than about ten pictures. To transfer more photos than that, you'll need to use a computer or a cloud service as the go-between for both phones. How to transfer a few pictures from Android to iPhone If you don't want to transfer your entire photo library from an Android to your iPhone, you can use the app Send Anywhere to quickly transfer select pictures. If two phones are in the same room, you can use the app to move the photos wirelessly from one phone to the other. Once you have Send Anywhere downloaded from the Google Play Store and the App Store, you can start transferring your pics: Open the Send Anywhere app on both phones. On your Android, tap Send at the bottom and select the pictures you want to transfer. Tap Send. On your iPhone, tap Receive at the bottom. Either type in the 6-digit code on your Android's screen or scan the QR-code. When you get to Step 3, you also have the option to send your pictures using a link if your phones aren't close to each other or the wireless transfer isn't working for some reason. How to transfer photos from Android to iPhone Manually selecting each photo won't really work if you're upgrading from an Android to an iPhone and want your entire photo library to come over with you. Thankfully, if you were using a cloud service like Google Photos to back up your photo library, it's easy to transfer to your new iPhone. Even if you weren't already using Google Photos, you can still download it to your Android from the Google Play Store and quickly set it up to start transferring all of your photos. To transfer your photo library using Google Photos: Open Google Photos on your Android. Sign in with your Google account. Tap Backup. Choose either High quality or Original. Tap Confirm. While your Android is uploading the pictures, you can download Google Photos on your iPhone and open it. Tap Get started. A prompt will appear asking to grant Google Photos access to your photos. Tap Continue. Tap No thanks to finish the setup, and the photos from your Android will start downloading to your iPhone. Any pictures you've taken with your iPhone will start uploading to Google Photos. Something to keep in mind during Steps 4 and 10 is that Google offers free unlimited storage using the High-quality setting, which compresses pictures to save them. However, if you choose Original for those steps, photos will be saved at full-quality and will count toward your Google One storage limit. After you move your photos to iPhone When you're setting up your new iPhone, it's a good time to start fresh, especially when it comes to your photo library. It's surprising how quickly your library can fill up with duplicate photos, similar-looking images, or even unnecessary screenshots. Thankfully, the iOS app Gemini Photos can help you quickly clean up your library, so you're not wasting any storage space on your new iPhone. To start cleaning up your photo library: On your iPhone, download Gemini Photos from the App Store. Open it and let it scan your photo library. Tap a category like Duplicates. Tap a group of photos. Select the pictures you want to delete. After you've gone through all of them, tap Delete Duplicates. You can then tap Your Library at the top to go back through the other categories of pictures and videos. Gemini Photos only scans pictures saved in iCloud or stored on your phone, so if you have pictures and videos in Google Photos, you'll have to download them to your phone before you can clean up your library and reduce the clutter. Whether you're going from Android to iPhone or iPhone to Android, there are a couple of ways you can get your pictures onto your new device. Whichever method you choose, it's important to have a bit of patience. It can take some extra time to transfer everything depending on how much you're trying to move at one time. (24 votes, average: 4.00 out of 5) Move to iOS not working is a fairly common problem. Almost half of the reviewers on Google Play rated Move to iOS app at 1 star out of 5. The good news is that you can easily transfer photos from Android to iPhone or iPad without Move to iOS or iTunes. This tutorial demonstrates how to copy pictures to iPhone from any Android device via simple drag and drop. The process takes two steps: Transfer photos from Android to PC Connect an Android device to your PC. Make sure to change USB preferences on the device to "File Transfer": open Notification center → Charging this device via USB → File Transfer. Open "This PC" and double-click on the name of your Android device. Navigate to the DCIM folder. It contains the photos you took on the device. Create a new folder on your Desktop and drag and drop the photos from the Android device to this folder. Transfer Android photos from PC to iPhone Now it is time to move the photos from the PC to your iPhone. Follow the steps: Download and install CopyTrans Photo: Download CopyTrans Photo Start the program and connect your iPhone or iPad to the PC. CopyTrans Photo displays photos from your iPhone on the left and PC folders on the right. Select the folder with Android photos in the rightmost pane, then drag it to the left. Click on "Apply changes" to save the Android photos to your iPhone. That's it. All the photos have been transferred to your iPhone. Andrew Grush / Android Authority Although we firmly believe the Android vs iPhone war should be long dead by now, the ecosystems of the two devices are still very distinct from one another. A new development project, though, has a plan to bring the two systems closer by making it easy to get Android on iPhones. "Project Sandcastle," as its known, has a brand new website up that gives you explicit instructions on how to get Android 10 on a handful of iPhones. As of now, the list of compatible iOS devices is fairly short, with just the iPhone 7, iPhone 7 Plus, and seventh-generation iPod Touch working with the hack. Even then, Android on an iPhone will be severely limited for now. Basic functions such as the camera, audio, cellular connectivity, and Bluetooth don't work yet. In other words, don't plan on flashing Android on an iPhone 7 Plus and using it as your daily driver. Dear Android and Apple fans: In 2020, can we permanently end the hate? Opinions Still, Project Sandcastle has promise. If you love Apple's hardware but can't stand to use iOS you could, in the future, have a viable option to swap it out for Android. Conversely, if there are features you love about Android that iOS doesn't offer, you could feasibly even swap back and forth between the two operating systems on a single device. It should be noted that this isn't the first time we've seen Android on an iPhone. Over ten years ago, a pair of developers got Android working on the very first iPhone. As luck would have it, those two developers — David Wang and Chris Wade — are part of the Project Sandcastle team. If you want to try out Android on an iPhone and have compatible hardware, you can check out the Project Sandcastle site here to give the beta a shot.
